The LIFELINE is a multi-phase development project that aims to knit Miami's urban fabric and promote a sustainable and resilient city. It connects the Wynwood and Edgewater neighborhoods with cultural connections for today and resilience for tomorrow. The project includes the following key elements:

1. **Elevate Mobility**: This component focuses on improving transportation options, including a new elevated bike path that connects many of the site's entries.
2. **Sustain Habitat**: This aspect involves creating green spaces and bioswales that treat floodwater while replenishing the local aquifer. A large bio-retention basin collects and treats floodwater.
3. **Celebrate Culture**: The project includes integration of local cuisine, which is showcased to enhance the local culture. It also includes connections to cultural destinations like the Wynwood and Edgewater sides of the site.
4. **Rail Corridor**: A new Tri-Rail stop on the LIFELINE is planned, along with a network of connections to the airports and local communities. This includes an urban scale distribution center.

The LIFELINE project is designed to increase pedestrian safety, especially with regard to on-grade rail crossings. The project also promotes access to Miami Beach, which is accessible through the LIFELINE.

By bringing together culture, sustainability, and accessibility, the LIFELINE project aims to make Miami a more vibrant and livable city.
